fogbuster

by Alex | No Comments

To get good cooling while milling aluminium I built a Fogbuster clone. This system uses minimal amount of coolant and is still highly efficient.

I got the drawings from a German forum (cncecke.de). I still have all the drawings in case you’re not able to find them there or they might be offline.

Milling aluminium with this system is working way better and I don’t have the problem off end mills cluttered with molten aluminium anymore.
